

#### **Graduated Thesis**

# A middleware framework to support scientific generation using an Al approach

Presenter: BA11-007 Nguyễn Tuấn Anh

Supervisor: MSc. Lê Như Chu Hiệp

#### **Table of Content**

### 01. INTRODUCTION

- Problem Statement
- Proposal System
- Objectives and Scope

### 03. SYSTEM DESIGN

- Overview Pipeline
- System Architecture
- System Implementation
- Backend Processing

05 CONCLUSIONS & FUTURE WORKS

### 02. REQUIREMENT ANALYSIS

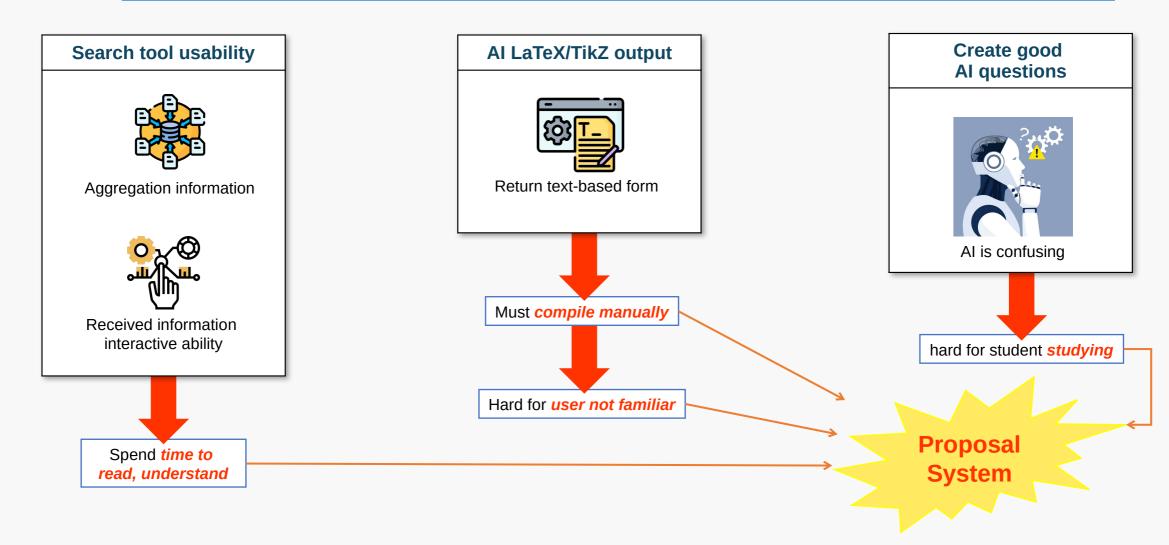

- Requirement
- System Functionalities

04. RESULTS & DISCUSSIONS

### 01. INTRODUCTION

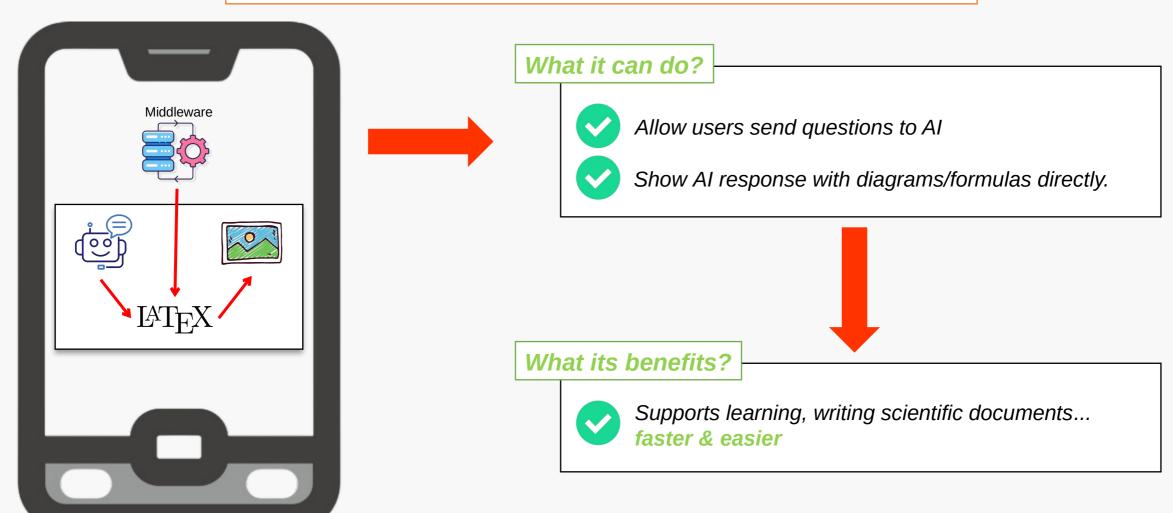

#### Problem Statement:

What problems exist when users use AI to learn, search and visualize scientific content?

### 01. INTRODUCTION

■ **Proposal System:** Al PELaX = Artificial Intelligence for Processing and Exploring LaTeX

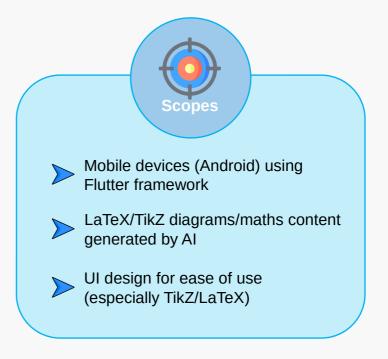

### 01. INTRODUCTION

#### Objectives and Scope:

Create a mobile application & middleware with scientific content generated by AI

### 02. REQUIREMENT ANALYSIS

#### Requirement:

01

#### **System Requirement**

#### **Core Function:**

- Flutter-based app displays results directly on Android devices.
- Automatically identifying & extracting LaTeX/TikZ code
- Displaying results directly inside application
- Rendering LaTeX/TikZ code into images through middleware Flask backend

02

#### **Non-Functional Requirement**

- **Performance:** System respond & render images quickly.
- Scalability: System work with different AI models via APIs.
- **User-friendliness:** UI is simple & easy use (people no LaTeX background).
- Offline support: App allows access saved content even when no internet connection.
- **Privacy and security:** User data are safe & not shared without permission.

### 02. REQUIREMENT ANALYSIS

#### System Functionalities:

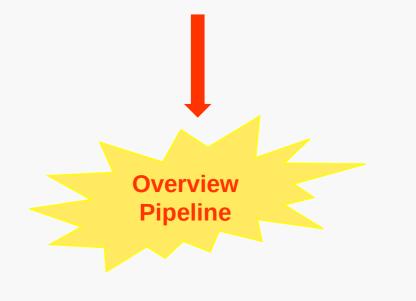

Table: Overview of System Functionalities

No	Feature	Description	Input	Output
1	Send Question	System allows the user to input a question and send it to the AI system	Raw user input (text prompt)	-
2	Return AI Response	AI Model receives the question and generates an appropriate LaTeX or TikZ code-based answer	User ques- tion	AI- generated LaTeX or TikZ text
3	Render LaTeX Code as Image	Middleware converts La- TeX and TikZ content into an image and returns it in Base64 format	turned from	Base64 ren- dered image

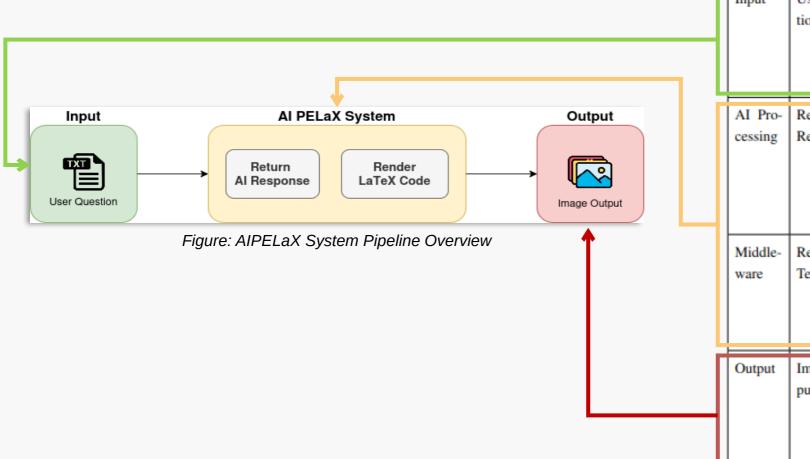

#### What do we **get** from the table?

#### 3 main features

- Send Question ---> Flutter UI
- Return Al Response ---> Al Model
- Render LaTeX Code as Image ---> Flask Middleware

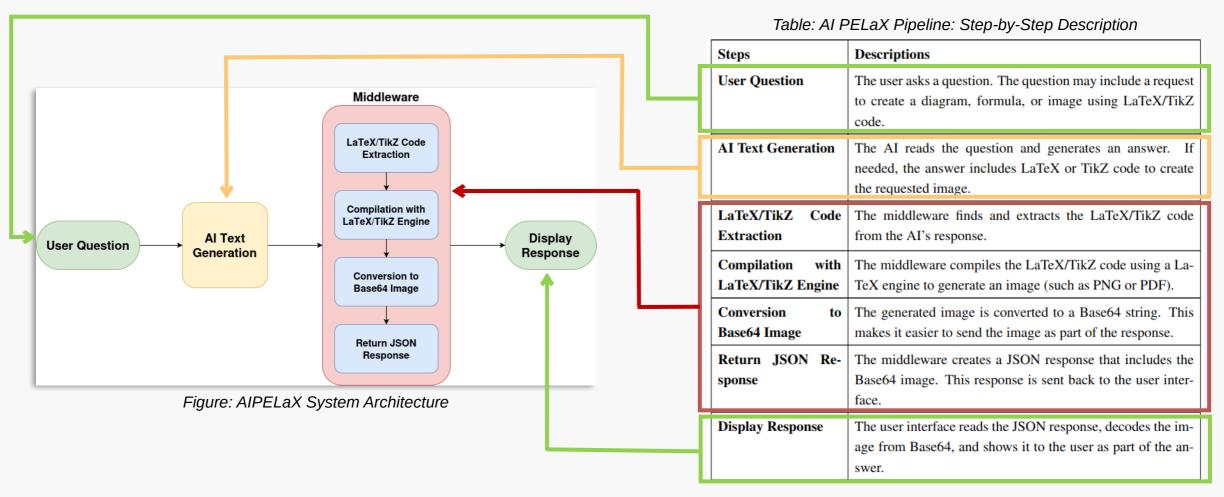

Overview Pipeline:

#### Table: Overview of System Functionalities

Stage	Component	Role	Actor	Input Format	Output Format
Input	User Ques- tion	The user submits a text-based question, possibly requesting a diagram, formula, or image.	User	Text	Text
AI Pro- cessing	Return AI Response	The system sends the question to an AI model and receives a response that may include LaTeX or TikZ code.	AI Model	Text	Text (with La- TeX/TikZ)
Middle- ware	Render La- TeX Code	The middleware extracts LaTeX/TikZ code from the AI response and compiles it into an image.	Middle- ware	LaTeX/TikZ Code	PNG / Base64 Image
Output	Image Out- put	The frontend decodes the image and dis- plays it to the user as part of the final an- swer.	Flutter App (UI)	Base64 Image (in JSON)	Displayed Image

#### System Architecture:

#### System Implementation:

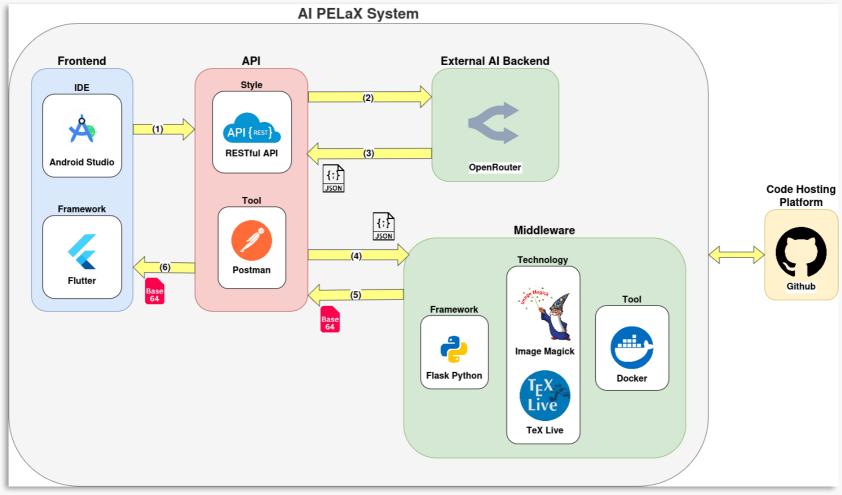

Figure: AIPELaX System Implementation

#### Backend Processing:

## Step 01 Survey Al Response Patterns

Used Model: DeepSeek Open-R1

Table: LaTeX Expression Types and Processing Strategies

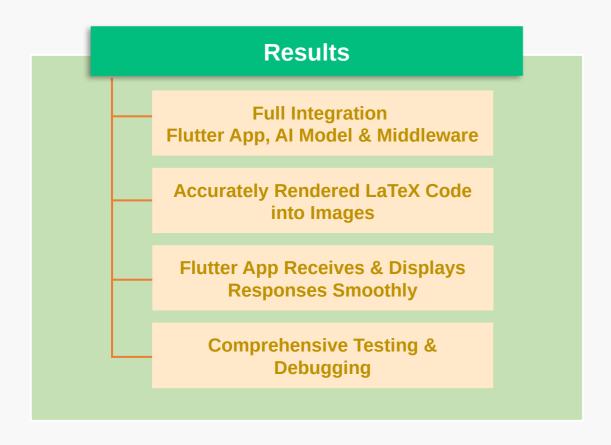

Expression Type	Delimiters Used	Typical Use Case	Processing Strategy
Inline expressions	\(\),\$\$	Short formulas embedded within text	Extract content, convert to display mode, and render as image
Block expressions	\[\], \$\$\$\$	Standalone, multiline equations	Extract full expression, render directly in display mode as image
Full LaTeX doc- uments	environments	Diagrams (e.g., TikZ), tables, full docs	Wrap code in a minimal LaTeX document, compile with pdflatex, and convert output to PNG

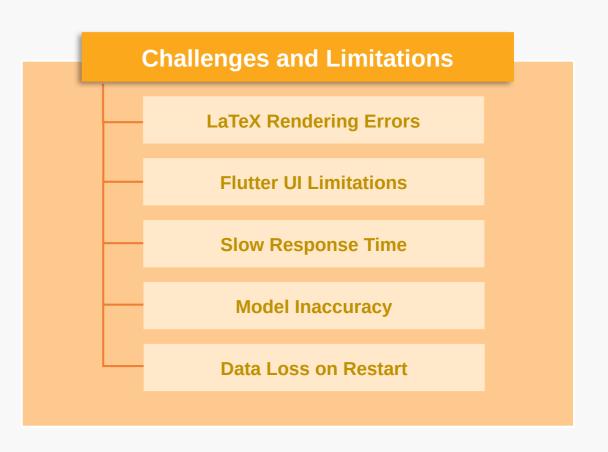

# Step 02 Backend Implementation

01	02	<b>03</b>	
Backend Architecture	Parsing and Extraction Logic	Docker Packaging	
<b>Framework</b> Python Flask	Goal: clean debugging, maintainable backend structure  Input formats: inline, block, full docs, markdown-style LaTeX  Main file: app.py – handles parsing & routing logic	Goal One-command launch & Saved Code	
API Endpoint POST /render_latex	Renderer file: latex_renderer.py – LaTeX → PNG (base64)  Function: render() – cleans, detects formats, delegates rendering	<b>Tool:</b> Docker – bundles LaTeX, Python, ImageMagick	
Structure • app.py • latex_renderer.py	Function: parse_inline_latex() — extracts inline math patterns  Steps: UUID → .tex → .pdf → .png → base64 string  Error handling: returns plain text if LaTeX fails		
	File structure: organized into outputs/tex, pdf, aux, logs, png		

### 04. RESULTS & DISCUSSIONS

#### Results:

### 04. RESULTS & DISCUSSIONS

**Discussions:** 

	Criteria	AI PELaX	ChatGPT	Claude	Gemini	
	atform pe	Mobile App	Web-based, Mobile App	Web-based, Mobile App	Web-based, Mobile App	
Proposition Proposition	ompt Sup- rt	General, scien- tific prompts	General, scien- tific prompts	General, scien- tific prompts	General, scien- tific prompts	What can our system do
La pu		Yes	Yes	Yes	Yes	
Til	kZ Support	Full render- ing	Text only	Text only	Text only	
La	ntomatic TeX Image endering	Yes	Yes	No	Yes	
	itable for lucation	Highly suit- able	Partial	Partial	Partial	

### 05. CONCLUSIONS & FUTURE WORKS

#### Conclusions:

#### **Practical Problem**

Based-text format AI generates scientific content (LaTeX, TikZ)

→ Difficult viewing without technical expertise.

#### Proposal System

Develop middleware system between AI & App

→ Automatically extract & visualize TikZ content.

#### Advantages

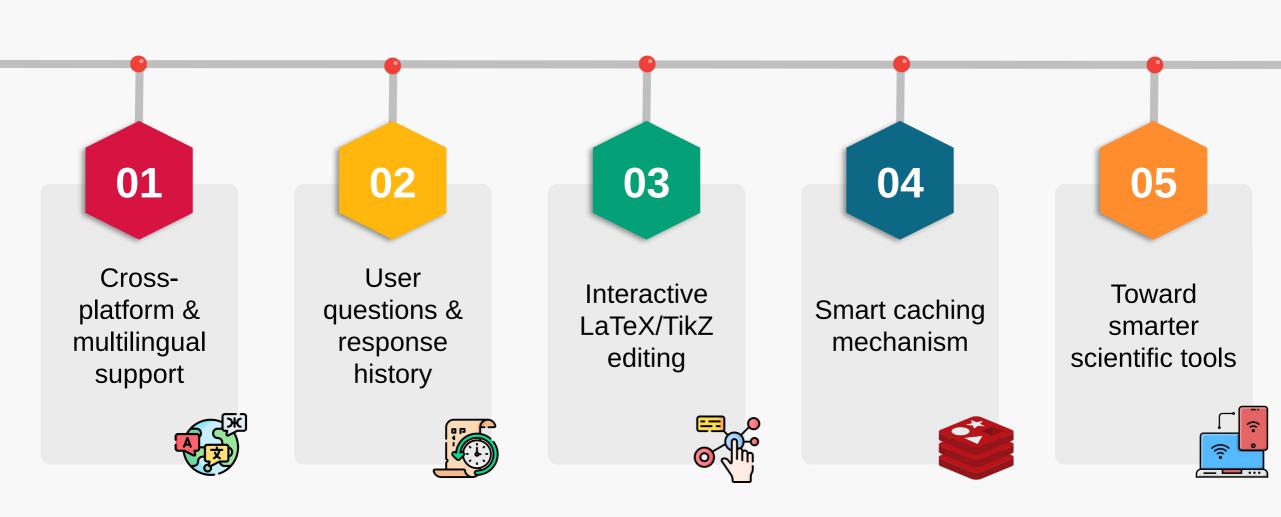

- User-friendly interface
- Fast & secure processing
- Can run directly without 3rd platforms

#### **Practical Significance**

- Education, Learning, Modern Scientific Researching
- Serves as foundation for future deeper integration AI & scientific visualization

### 05. CONCLUSIONS & FUTURE WORKS

#### Future Works:

#### Demo

Figure: Docker Backend Deploy Running

```
anhnt02@anhnt02: ~/Desktop
                                                          anhnt02@anhnt02:~/Desktop$ docker start my-flask-api
                                                         my-flask-api
                                                          anhnt02@anhnt02:~/Desktop$ docker logs -f my-flask-api
                                                          * Serving Flask app 'app'
                                                          * Debug mode: on
Demo
                                                          * Running on all addresses (0.0.0.0)
                                                          * Running on http://127.0.0.1:5000
                                                          * Running on http://172.17.0.2:5000
                                                          * Restarting with stat
                                                          * Debugger is active!
                                                          * Debugger PIN: 123-487-038
                                                         192.168.92.3 - - [20/May/2025 08:50:48] "POST /render latex HTTP/1.1" 200
